"Method of Preparing Quaternary Phosphonium Chlorides"

USSR Authors' Certificate No 250131, filed 23 Mar 68, published
4 Jan 70 (from RZh-Khimiya, No 20 (II), 25 Oct 70, Abstract No
20 N553P by I. M. MIL'SHTEYN)

Translation: Compounds of the general formula $\overset{\text{I}}{\text{R}}\text{ }(\text{R}')\text{P}(\text{CH}_2\text{X})$
 $(\text{CH}_2\text{-Y})_7\text{Cl}^-$ (I) (R and R' = alkyl, Ph, PhCH₂, substituted Ph,
or PhCH₂; and X and Y are substituted or unsubstituted aryl) $\overset{\text{I}}$,
which may possess physiological activity, are obtained by con-
jugated alkylation of chloro or dichlorophosphines with benzyl
chlorides at 170-320°. I₂ or Lewis acids can be used as catalyst.
The process can be initiated by UV irradiation. A mixture of 0.03
mole benzyl dichlorophosphine, 0.04 gram atom white Ph and 0.135
mole PhCH₂Cl is heated in a stream of N₂ until distillation of
PCl₃ ceases (3-3.5 hours); excess PhCH₂Cl is distilled off the
residue is dissolved in alcohol, and kept in a crystallizer 19-
20 hours, and I (R = R' = PhCH₂, X = Y = Ph) is separated out.

"A Method of Synthesizing 1,4-Phenylenhexabenzylidiphosphonium
Chlorides"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye
Znaki, No 14, 1970, Author's Certificate No 266418, filed 7 Jun
68; p 23

Abstract: This Author's Certificate introduces: 1. A method of
synthesizing 1,4-phenylenehexabenzylidiphosphonium chlorides. The
distinguishing feature of this procedure is that 1,4-phenylene-
bis-dichlorophosphine is interacted with substituted benzylchloride
and white phosphorus in the presence of heat with subsequent
isolation of the goal product by conventional methods. 2. The
method described in (1) is distinguished by the fact that the
temperature reaches 170-220°C.

Abstract: This Author's Certificate introduces: 1. A method of producing 1,4-bis-(dialkyl- or dibenzyltrithiophosphoryl)benzene. The distinguishing feature of the method is that 1,4-bis-(dichlorothiophosphoryl)benzene is interacted with alkyl halides or benzyl halides and hydrogen sulfide accompanied by heating in the presence of a catalyst with subsequent isolation of the product by conventional methods. 2. A modification of this method in which the distinguishing feature is that the process is carried out at a temperature of 120-170°C. 3. Another modification of the method described in sections 1 and 2 with the distinguishing feature that an organic base such as pyridine is used as the catalyst.

KVASHIN, Ye. V. and CHERMAHENTSEV, S. A."Operative System for Seismological Data Input to an Electronic Computer"

Tashkent, Izvestiya Akademii Nauk' Uzbekskoy SSR--Seriya Tekhnicheskikh Nauk, No 6, 1973, pp 7-9

Abstract: An important and complex problem is the input of multi-channel analog signals into an electronic computer directly from objects under observation, with simultaneous operative processing. The purpose of this article is to consider the input of seismological information continuously, through radio relay channels, into a central processing point equipped with the Minsk-22 computer from four seismic stations in the Tashkent geodynamic polygon. A system for gathering this information and automatically processing it is proposed in this article, together with a diagram and a textual description of the units involved and their interconnection. The units are listed and their functions outlined. It is noted that a working design and mock-ups of the various units of the system have been developed.

INTRODUCES A DEVICE FOR RECEPTION OF ORTHOGONAL BROAD BAND RADIO
SIGNALS. THE UNIT CONTAINS CHANNEL MULTIPLIERS, NOISE GENERATORS,
INTEGRATORS AND A COINCIDENCE CIRCUIT. IT DIFFERS BECAUSE TO PROVIDE
FOR COHERENT RECEPTION OF WIDE BAND SIGNALS, THE SIGNAL FROM THE OUTPUT
OF THE CHANNEL MULTIPLIERS IS FED TO THE SIGNAL INPUTS OF THE
CORRESPONDING COHERENT CHANNEL DETECTORS, WHILE A COMMON SINUSOIDAL
REFERENCE VOLTAGE FROM THE OUTPUTS OF THE CHANNEL MULTIPLIERS IS
SIMULTANEOUSLY APPLIED ACROSS THE SECOND INPUT OF THE COHERENT DETECTORS
THROUGH A SUMMING CIRCUIT, NARROW BAND FILTER AND PHASE INVERTER.

Nauch. tr. Omsk. vet. in-t. (Scientific Works of the Omsk Veterinary Institute)
1970, 27, No 2, pp 41-42 (from RZh-30. Meditsinskaya Geografiya, No 1, Jan '71,
Abstract 1.36.103)

Translation: Foot-and-mouth disease in Omskaya Oblast is distributed through the south and east where cattle-raising is more intensive. It occurs only rarely in the north; the Ust'-Ishimskiy rayon, for example, has had no cases for the last 25 years. In the oblast types of foot-and-mouth disease are: type O, variant O₂, type A, variant A₇, while in 1967 the foot-and-mouth disease epizootic was caused by type A virus, variant A₂₂. The study of viral type over the last 11 years yields data indicating that virus types change every 3-4 years. In 1963-1968 there was a significant decrease in the disease distribution. By November 1967, foot-and-mouth disease type O and A--variant A₇ were eradicated in the oblast.

"A Reception Device for Orthogonal Wide-Band Radio Signals"

USSR Author's Certificate No 262940, filed 5 May 68, published 3 Jun 70
(from RZh-Radiotekhnika, No 11, Nov 70, Abstract No 11D96 P)

Translation: The device introduced by this patent provides coherent reception of orthogonal wide-band signals by the method of synchronous heterodyning. Signals are fed from the output of channel multipliers to the signal inputs of the corresponding coherent channel detectors. A common sinusoidal reference voltage from the outputs of the channel multipliers is fed to the second input of the coherent channel detectors through an adder, narrow-band filter and phase shifter. The device is designed for radio telegraph communications systems with an active pause. N. S.

"Fundamentals of Alloying Steel and Weld Metal for Structures Operating
Continuously at Low Temperatures"

Kiev, Problemy Prochnosti, No 8, Aug 70, pp 119-125

Abstract: Results are presented of a series of investigations for determining the mechanical properties of Cr-Ni-N and Cr-Ni-Mn-N steels for the purpose of establishing optimal quantities of alloying elements for obtaining austenite-stable steels under conditions of long-duration operation at low temperatures (to - 100°C). The results show that a 15% Ni content in Cr-Ni-N and Cr-Ni-Mn-N steels is sufficient for complete austenite stability. The effect of alloying metals on the mechanical properties of steels and weld metals is shown in graphs.

of High-Alloy Austenitic Steels at Low Temperatures"

Kiev, Problemy Prochnosti, No 6, 1970, pp 99-103

Abstract: In the article are presented results of research
carried out with the aim of ascertaining the influence of
nitrogen alloying upon the tendency of some austenitic steels,
used in cryogenics, toward brittle destruction. 7 figures,
1 table, 7 bibliographic entries.

"Blue-Green Algae From the Kremenchug Reservoir as a Raw Material for
Growing Microorganisms"

Kiev, Gidrobiologicheskiy Zhurnal, Vol 7, No 6; Nov/Dec 71, pp 80-83

Abstract: Blue-green algae of the Kremenchug reservoir contain a considerable amount of polysaccharides both easy and difficult to hydrolyze, including easily accessible ones for assimilating glucose, mannose, galactose, and xylose. They are also rich in protein substances which can, upon hydrolysis, be converted into amino acids and used in the process of growing microorganisms. Algae contain a sufficient amount of ash elements, but they are poor in phosphorus. Blue-green algae contain a large selection of B-group vitamins. These algae contain all the components necessary for the development of heterotrophic microorganisms used in the brewing and food industry. The necessary number of components can be balanced.

"Adenine-Dependent Mutants of the Yeast Rhodotorula gracilis and Their Fat-
Forming Ability"

Kiev, Tsitologiya i Genetika, No 2, 1971, pp 112-115

Abstract: The ability to synthesize lipids was studied in adenine-deficient
mutants of Rhodotorula gracilis induced by ultraviolet radiation. The sur-
vival rate of cells decreased with increasing dose of UV rays: from 52.4% at
a dose of 500 erg/mm² to 0.0028±0.0022% at a dose of 10,000 erg/mm². UV
irradiation induced six auxotrophic mutants which required the presence of
adenine hydrochloride (from 10 to 100 µg/ml) in the medium for good growth.
The optimum dose for inducing adenine-dependent mutants was 4,000 erg/mm²
which gave rise to one mutation per 5,755 cells (0.015±0.04%). The adenine-
dependent mutants were found to have a low capacity for synthesizing lipids.
While the control strain formed 52.4% of the lipids, the adenine-dependent
mutants formed only 10.4 to 24.4%.

"Biochemical Processes During Oil Displacement Under the Influence of Bacteria
in Model Experiments"

Kiev, Mikrobiologicheskiy Zhurnal, Vol 33, No 2, Mar/Apr 71, pp 234-239

Abstract: Introduction of selected cultures of gas-forming bacteria from the genus Clostridium together with a molasses medium into an artificial model of an oil-bearing bed (sand saturated with oil) results in higher displacement of oil as compared to the control (without addition of bacteria). Most crucial changes in the medium enriched with bacteria occur in 5-7 days at an optimum temperature of 30°C, that is during the period of most intensive changes in the nutrient medium and maximum gas production. At that time the surface tension at the interphase culture medium-air is lowered, the amount of organic acids and ethanol is increased and the pH of the medium is lowered. The specific gravity of the oil exposed to bacteria is lowered by 0.0018-0.0096 g/cm³, and its viscosity is lowered by 0.51-3.0% cst, without any changes in its fractional composition.

"Effectiveness of Nozzle Blades Made by Diffusion Welding Through an
Intermediate Layer"

Moscow, Svarochnoye Proizvodstvo, No 1, Jan 73, pp 32-34

Abstract: The purpose of this work was to investigate the efficiency of full-scale nozzle blades produced by vacuum-diffusion welding through an intermediate metal layer. The usual method of welding, in which the metals being joined are melted, such as high-alloy heat-resistant alloys E99, VKh4A, E1602, etc., results in the formation of hot cracks in the seam metal and heat-affected zone. For intermediate layers VPr7 and VPr11 brazing alloys and Kh18N9T steel were used which were 0.1 mm thick.

The welded blades were subjected to both thermal cycling and mechanical loads of 3000 cycles and 16 or 22 kgf/mm², respectively. Results of these tests showed that damage characteristic of thermal fatigue was not detected when the samples were subjected only to thermal cycling; however, when subjected

V ab. Gidrokhim. issledovaniya (Research In Chemical Hydrology -- Collection of Works), Makhachkala, 1972, pp 88-89 (from RZh-Biologicheskaya Khimiya, No 21, 10 Nov 72, Abstract No 21F2061 by N. I. Malakhova).

Translation: The study of the toxicological and hygienic characteristics of N-vinylpyrrolidone (I; $C_9H_{11}NO$; classified with vinyllactams; colorless liquid) proceeded on the assumption of an approximately permissible concentration of I in the air of the working zone of 1 mg/cu m. When I was administered to rats by stomach, LD₅₀ was 2 g/kg; LD₅₀, calculated according to the Korber method, was 1.375±0.114 g/kg. When I was administered per os, the mucous membranes of the upper respiratory tract were irritated. In acute peroral administration, symptoms of irritating and narcotic effect were noted. Local action of I was weakly manifested; however, 100 percent of the experimental animals died in 1-2 days. It is concluded that I possesses sharply pronounced ability to penetrate the intact skin.

USSR Author's Certificate No 258127, Filed 18 Aug 69, Published 16 Apr 70 (from
RZh-Radiotekhnika, No 10, Oct 70, Abstract No 10V315 P)

Translation: The proposed device contains a drum type cassette with two parallel rows, arranged in several levels, a loading vibration hopper, transporting mechanism, guide channels with rotating gates, a measuring unit and an actuating electromagnet. As a distinguishing feature of the patent, the work productivity of the device is increased and sorting precision is improved by utilizing a unit for storing combinations of resistance measurements connected to the transporter drive. This unit is made in the form of a hollow cylinder with movable pins around the periphery in several rows. These pins are connected to electromagnets by means of levers. The electromagnets are connected to the measurement unit and are mounted on the column of a master unit located inside the hollow cylinder. The contacts controlled by the movable pins are connected in the control circuit of the actuating electromagnet.

"Decomposition of Molybdenum-Titanate Martensite"

Moscow, Izvestiya Akademii Nauk SSSR, No 5, 1973,
pp 225-230

Abstract: A study made of the decomposition processes of supersaturated α' -solid solutions of the Ti-Mo system in the whole range of their development is based on different methods of physico-chemical analysis supplemented by structural investigations. The effect of martensite decomposition processes on the mechanical properties was investigated on alloys with 8.0 and 8.6 wt% Mo; their change in Young's modulus and in mechanical properties after heating to different temperatures is shown. The decomposition of supersaturated α' -solid solutions

1/2

- 51 -

USSR

FEDOTOV, S. G., et al., Izvestiya Akademii Nauk SSSR, № 5, 1973, pp 225-230

of Ti-Mo martensite (up to 6 wt% Mo) takes place in the temperature interval at continuous decrease of the temperatures of beginning and ending decomposition with increasing Mo-content. In higher alloyed alloys (6-11 wt% Mo) possessing $(\alpha' + \beta + \omega)$ -phases, the temperature of beginning decomposition of the α' -component does not decrease with changing composition of the alloy; it remains on the temperature level of the decomposition of the supersaturated martensite with 6 wt% Mo. The possibility of a controllable change of the mechanical properties of the alloys in a wide range at decomposition of the martensitic structure is indicated. "Dispersion of Magnesium Powder Produced by Vacuum Condensation"

Moscow, Izvestiya Akademii Nauk SSSR, Metally, No 6, 1973, pp 91-95.

Abstract: This article presents results concerning the influence of a number of technological parameters such as evaporation temperature, cooling agent temperature and residual gas pressure on the dispersion and the shape of particles of metallic magnesium condensing in the volume and on the surface. The study of the process of vacuum condensation of magnesium on a cooled moving surface showed the complexity of the powder-formation mechanism, combining crystallization of particles in the volume with growth of crystals on the surface. Increasing the evaporation temperature, with other parameters constant, improves the conditions for surface growth of crystals, reducing the dispersion of the powder and changing the form of its particles. A simultaneous increase in evaporation temperature and increase in residual pressure in the system helps to form a coarse powder. Increasing the temperature of the crystallization surface results in the formation of a powder which is more homogeneous in shape and size and more highly dispersed. In many modes of condensation, a homogeneous powder with particle sizes of 0.1-0.2 μ can be produced.

levers (4,6) during their balancing, they are in turn stopped by cams (stops 12,13). After the levers are balanced, the knife edge (F) is brought in contact with the bearing pad (15) by varying the push-rod (14) length, without altering the lever (4,6) balance position. Then the calibrating weight (16) is used for checking the beam (17).

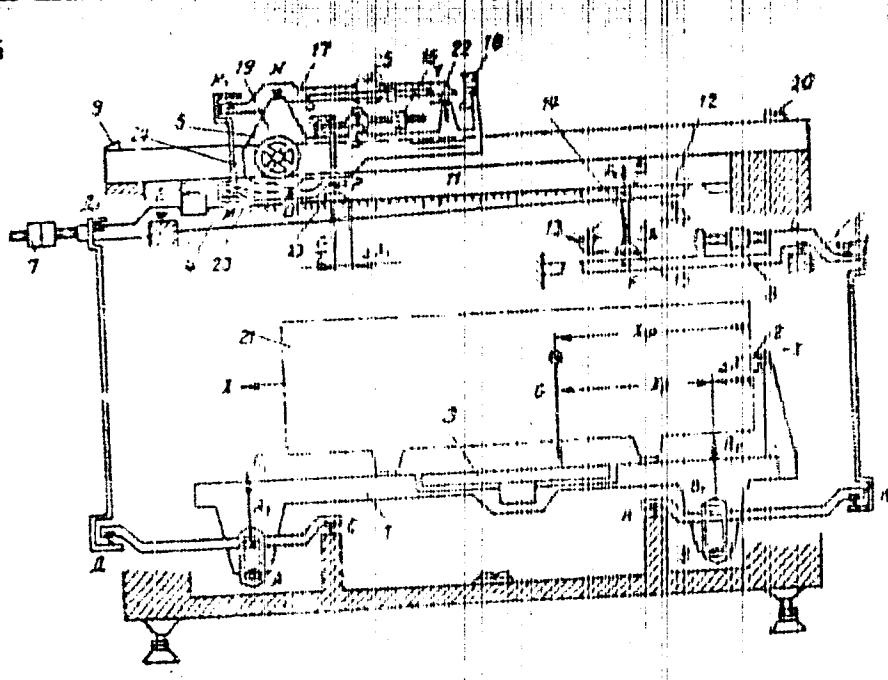

When the calibration is completed, the weighing head (5) is moved by a drive (19) to the stop (20). The cursor (6) sliding on the summating lever (4) surface, should not upset the lever systems balance. The object (21) centre of gravity is determined along the axes X,Y and Z using stops (13,22), lever (24) and weights (25).

"Determination of Soluble and Bonded Aluminum in Steels Containing Titanium"

Moscow, Zavodskaya laboratoriya, No 5, 1971, pp 538-539

Abstract: A method for determining aluminum and aluminum oxides in steels containing titanium is said to be superior to that recommended by GOST 11658-65. The GOST method cannot be used for determining thousandths of a percent of aluminum content, whereas, the method described can. For determining aluminum in steels containing up to 0.2% Ti, a chromazurol reagent is used. This procedure is described as are procedures for determining the aluminum content of solid solutions. A table presents the results in determining the aluminum content of standard or synthetic specimens, such as the 126G and 155v types.

"The Use of Simazine in the Ovary of Vegetatively Propagated Apple Rootstocks"

Moscow, Khimiya v Sel'skom Khozyaystve, Vol 8, No 1, Jan 70, pp 48-50

Abstract: The author studied the effect of Simazine on clonal apple rootstocks in the ovary. Experiments were conducted in 1964-1967 at the Vitena Fruit and Vegetable Experimental Station in the Lithuanian SSR. The Simazine was applied in doses of 2, 3 and 4 kg/ha a. i. in October. The root stocks used were semidwarf III, MM 106, MKh 1 and PK 14. It was found that Simazine is effective against annual weeds in the ovary of apple rootstocks. The preparation does not impair layer rooting or reduce the yield per unit area of well rooted layers. Under conditions in Lithuania it is advisable to use Simazine in a dose of 2 kg/ha a. i. on slightly weedy podzolic soils and to increase the dose to 3-4 kg/ha on weedier soils.

"A Comparative Efficiency Characteristic of Different Immunization Methods
Against Plague Infection"

Moscow, Zhurnal Mikrobiologii Epidemiologii i Immunobiologii, No 11, 1972,
pp 106-112

Abstract: Analysis of the available literature data led to the conclusion that oral, aerogenic, and jet immunization methods are the most efficient compared with subcutaneous and skin methods. The average number of patients inoculated against plague infection was 517, 817 (419), and 937 per year for jet injectors, aerogenic method liquid and dry vaccine, and oral method (tablets), respectively, compared with only 43 and 20 for the subcutaneous and skin methods, respectively.

Soobshch. AN GruzSSR [Reports of Acad. Sci., Georgian SSR], 1973.
Vol 69, No 3, pp 561-564 (Translated from Referativnyy Zhurnal Kibernetika, No 10, 1973, Abstract No 10V788)

Translation: The application of the Robbins-Monroe method to a non-parametric procedure of learning recognition of patterns is studied. The dependence of the length of the search for the optimal discriminant function with two methods of learning on the order of presentation of images during the process of learning is experimentally studied. The first -- the method of formalized learning -- assumes that the position of the weight vector changes in each step of iteration. In the second learning method -- the method with error correction, the change in the weight vector occurs only upon false assignment of an image to the wrong class. The results make the advantages of the second method obvious, consisting in a significant reduction of learning time and independence of this time on the sequence of presentation of images.

"A Case of Listerial Angina in Tbilisi"

Moscow, Zhurnal Mikrobiologii Epidemiologii i Immunobiologii, No 5, May 71,
pp 144-145

Abstract: Listeriosis is one of the diseases which have not yet been investigated among the inhabitants of Georgia. One case of listeriosis was identified in Tbilisi in 1969 in a 6-year old boy who was admitted to the City Hospital with a diagnosis of infectious mononucleosis. He was successfully treated with streptomycin -- a total of 4,800,000 units given in doses of 200,000 units (every 12 hours) and supplemented with vitamins -- and recovered after about 2 weeks, when he was discharged from the hospital. Bacteriological examinations performed on mice caught in the house where he lived were negative, and thus the source of infection was not established. Reports on the study of listeriosis among farm animals in Georgia were published in 1953, 1957, and 1965. Evidence suggests that human listeriosis in Tbilisi is more frequent

"Using the Method of Random Walks to Solve Problems in Elasticity Theory"
Kiev, Problemy Prochnosti, No 4, Apr 73, pp 53-57

Abstract: The probabilistic method of random walks over spherical surfaces is used to solve problems in elasticity theory. The paper gives the results of digital computer solution (BESM-6, FORTRAN) of the second fundamental problem of elasticity theory for a circle and a ring. The accuracy and economy of the method are studied. The results show an error of less than 5% in displacements, and less than 10% in stresses. The effective time of solution with evaluation of variance $D[\psi] < 0.05$ for a single point fluctuates from 1.5 to 2 minutes. With an increase in the number of random walks ($N > 30,000$), the instability of the random number generator (RNDM) places a limit on accuracy.

"Determination of Stress Concentration in a Plate Around a Small Aperture
in the Three-Dimensional Statement of the Problem"

Kiev, Problemy Prochnosti, No 3, Mar 73, pp 47-49.

Abstract: The problem is stated as follows. A circular plate with external circumference of rather large radius is cut from an "infinite" plate with an aperture of radius a . It is assumed that stresses around the circumference are the same as in a plate without apertures. The equations for elastic equilibrium of bodies of rotation, based on the variation-difference method, are used for a new approach to the solution of the problem of the influence of circular apertures on stress distribution in a plate in extension. The results of numerical solution of this problem based on equations of the three-dimensional problem of the theory of elasticity are presented and compared with the precise analytic solution.

"Investigation of the Stress State of Thick-Wall Shells (Applicable to the Design of a Turbine Housing)"

Kiev, Problemy Prochnosti, No 3, Feb 73, pp 39-42

Abstract: Resolving equations, derived on the basis of the variation-difference method, for the deformation of solids of revolution under axisymmetrical actions were used for studying the stress state of turbine structural elements. A static calculation was carried out for the front section of a steam turbine housing which itself is a thick-wall shell of revolution consisting of a cylindrical wall connected to a toroidal bottom. Isolines of displacements and stresses were drawn and an analysis of the shell stress state was made. Calculations were made on a BESM-3M computer using a program based on the block method of Gauss. With consideration of shell and load symmetry, a system of algebraic equations of the 386th order was solved. From point displacements found, the stress tensor components were calculated on the computer. 2 figures, 2 bibliographic references.

"Study of the Stressed State of Bodies of Rotation of Arbitrary Configuration
Under Tortion. Communication 1"

Kiev, Problemy prochnosti, No. 8, Aug 71, pp 3-7

Abstract: The AL'GIER program is presented for determining stresses under torsion of a body of rotation of arbitrary form. The AL'GIER language is a hardware representation of the input language used by the AL'GIER translator. It is noted that many structural elements in modern turbines have the shape of bodies of rotation of complex form and that they are subject to a complex of external loads causing torsion, bending, stretching, and axisymmetric deformation. This article is devoted to calculating the strength of such elements under torsion. It is pointed out that it is necessary to know the greatest stresses in the zone of the structural concentrator but that it is possible to make an exact analytical determination of these stresses only for a very limited class of structures, since the majority of such problems are not subject to solution by classical methods. Computer methods are therefore applied. A

system of finite difference equations is derived for the stress state of a body of rotation of any form under torsion. Various approaches to the construction of the finite-difference grid are discussed. It is recommended that a grid of arbitrary triangles or rectangles be used to ensure the necessary bunching in the zone of structural concentrators and at the boundary of the region, and using only a minimum number of grid points in the remaining part of the region. In this case a grid of arbitrary rectangles was used to ensure a good approximation of the curved boundary.

"Low-Frequency Dielectric Transformers"

Kiev, Poluprovodnikovaya tekhnika i mikroelektronika, No 6, 1971, pp 69-70

Abstract: A study is made of the problems of creating low-frequency dielectric transformers. Several versions of the designs of such transformers are investigated, and data are presented for individual specimens. Conclusions are drawn regarding the prospects of utilization of low-frequency dielectric transformers. In the transformers, the transformation coefficient depends to a significant extent on the magnitude of the input signal. With a load of 10^6 ohms and an input voltage of 0.1 volts, it reaches values on the order of 20 for one of the investigated transformers manufactured on the basis of the type TgTS-23 ceramic. A formula is presented showing that the basic parameters affecting the resonance frequency of piezotransformers of the flexible type are the length and thickness of the plates. The parameters of several designs of piezotransformers and their operating frequencies are presented in a table.

"Low-Frequency Dielectric Transformers"

Kiev, Poluprovodnikovaya tekhnika i mikroelektronika, No. 6, 1971,
pp 69-70

Abstract: This short informative article amounts to an introductory treatment of the development of piezoelectric transformers with an operating frequency of 50 and 400 Hz, of the type widely used in technology. A schematic diagram of piezoelectric transformers of the bending type is shown and explained; it consists of two dielectric plates glued together with epoxy resin, and connected through copper or silver electrodes to the external circuit. The theory of operation of the transformer is explained in qualitative terms, and a formula for the fundamental frequency of the bending oscillations is given in terms of the Young's modulus, the density, the thickness, and the length of the second -- i.e., the output or bending -- plate of the transformer. Curves are plotted for the transformer characteristic as a function of the bending magnitude; they indicate that the transformation characteristic depends essentially on the $1/2$

"Chlorella Mutants Resistant to the Photophosphorylation Inhibitor 3(3,4)-Dichlorophenyl-1,1-Dimethylurea (DCMU). II. Mutagenic Effects of DCMU on Different Strains"

Moscow, Genetika, Vol 7, No 5, 1971, pp 36-41

Abstract: In concentrations of 10^{-3} to 5×10^{-3} M, DCMU has both lethal and mutagenic effects on Chlorella strains of two different origins: Chlorella vulgaris original strain B and its more resistant mutant B₄₁, and Chlorella pyrenoidosa original strain 82 and its more resistant mutant 82. Equal concentrations of DCMU inhibit the original strains to a much greater degree than the mutants. After Chlorella cells adapt to DCMU, its lethal effect becomes considerably smaller. Adaptation to DCMU does not eliminate its mutagenic effect in the above-mentioned concentrations; as a result, the resistant strains are more mutable. The mutations include: 1) mutants which restore their pigment to initial color in the light but lose it again in

1/2

USSR

MUKHAMEDIYEV, B. T., et al., Genetika, Vol 7, No 5, 1971, EP 36-41

darkness; 2) mutants which die in the light; and 3) mutants which partly preserve their pigment. The mutagenic effect of DCMU is considerably smaller than that of N-nitroso methylurea, while its lethal effect is markedly greater.

"Epidemiological Significance of Mild Atypical Forms of Diphtheria Under Present
Conditions"

Kiev, Vrachebnoye Delo, No 8, Aug 70, pp 145-149

Abstract: The incidence of diphtheria in the USSR has declined sharply since the end of World War II, from 150 per 100,000 population in 1944 to only sporadic cases in 1966. However, this decrease in the diphtheria rate has not been matched by a corresponding decline in the number of carriers of diphtheria bacilli. Studies conducted in 1964 and 1965 in Kiev revealed that 2.5% of all healthy children examined, and about 15% of children in boarding schools and similar groups, were carriers. The disparity between the incidence of diphtheria and the number of carriers is thought to be due largely to a failure to diagnose mild, atypical forms of the disease. These forms are common in immunized children, in whom the characteristic symptoms include subfebrile temperature, mildly hyperemic throat, and slight enlargement of the lymph nodes. The number of cases of children with sore throat who also carry diphtheria bacilli is increasing from year to year. The carrier state and sore throat may be regarded as interrelated.

"Studies of the Nonsteady State Operating Conditions of Hydroelectric Power Plants"

Sb. tr. po gidrotekhn. i hidrostr-vu. (Collected Works on Hydroengineering and Hydropower Construction), Moscow, Nauka Press, 1970, pp 192-205 (from RZh-Elekrotekhnika i Energetika, No 4, Apr 71, Abstract No 4 D133)

Translation: The procedure for calculating the transient processes and selecting optimal hydroturbine regulating conditions was improved on the basis of natural and model studies of the behavior of hydroturbines in a broad range of operating conditions, including running up and running down. In a number of cases, application of this procedure permits proof of the possibility of constructing closed-delivery conduits without UR with inertial constants up to 4-6 seconds and more. Examples of hydroelectric power plants are presented (Nurek, Charvak, Kuban'-Kalausskiye, and others) providing a basis for doing away with UR. In selecting the turbine regulating conditions and designating the limiting rate of variation of opening of the distributor, it is proposed that the turbine characteristics be used considering the 1/2

KRIVCHENKO, G. I., et al., Sb. tr. po gidrotekhn. i gидроэнергетике. (Collected Works on Hydroengineering and Hydropower Construction), Moscow, Nauka Press, 1970, pp 192-205 (from RZh-Elektrrotekhnika i Energetika, No 4, Apr 71, Abstract No 4 D133)

hydraulic impact for the given law of variation of the opening with time. As applied to the underground version of the Toktogul Hydroelectric Power Plant, a procedure is described for determining the instantaneous pressure diagrams under the runner during the entire process of nonsteady state operating conditions. The diagrams obtained make it possible to establish the deep vacuum regions for individual points in time. For hydroelectric power plants with long closed delivery conduits a procedure and research results are presented with respect to establishing the possible deviations caused by the nonstationarity of the operating conditions. For hydroelectric power plants with adjustable blade turbines, variation of the direction of the axial force on the runner, occurrences of deep vacuum under the top of the turbine and the possibility of discontinuity of the flow beyond the distributor and the runner and significant accelerating rpm are considered. There are 45 illustrations and an 18-entry bibliography.

"Superhigh Frequency Power Instability Meter"

USSR Author's Certificate No 252420, Filed 25 Apr 68, Published 12 Feb 70,
(from RZh-Radiotekhnika, No 9, Sep 70, Abstract No 9A138P)

Translation: A superhigh frequency power instability meter containing a modulator-synchronizer is proposed. The meter regulates the element, the reference voltage source and the autobalancing thermistor bridge. The purpose of the invention is to increase the measurement accuracy. For this purpose, the output of the thermistor element is connected via an amplitude detector and a preliminary amplifier to the phase detector. The latter is connected with the modulator-synchronizer and with the regulating element connected to the reference voltage source via a measuring regulator.

INSTITUTE ISSUES PERTAINING TO PLANNING AND CONSTRUCTION OF EXPERIMENTAL VILLAGES

Edited by D. N. Zhdanov, K. S. Zubkov, M. G. Sandal'ev

(Glavnoye Nauchnoye Vsesoyuznoye Institut Selskogo Hoz. SSSR, Moscow, No. 7, 1952).

pp. 36-37.

In the Soviet Union, much attention is given to the growth of agricultural production. In accordance with the Five-Year Plan of development of the national economy of the USSR, in 1951-1955, the mean annual agricultural output will increase by 20-22 percent, while state investments of capital for the needs of agriculture, including production, housing, and cultural building and purchase of technique, will constitute 82.2 billion rubles.

The socialist transformation of agriculture is associated with a rapid improvement of sanitary living conditions for the rural population.

In defining the Party strategy in this regard, the Program of the CPSU directs our attention to the fact that "gradually, collective farm settlements and villages will be transformed into larger appropriate centers of the urban type with housing supplied with all amenities, municipal services, utilities, cultural and medical institutions. Ultimately the cultural and living conditions for the rural population will be comparable to those of urban residents. Realization of socioeconomic and cultural and living distinctions between the city and villages is one of the greatest results in the building of communism" (Central Committee of the Communist Party of the Soviet Union, 1951, p. 55).

More recently major strides have been made in the area of building up rural populated regions.

However, along with the achievements in rural construction there are also substantial flaws of an architectural-planning and sanitary-hygienic nature. For example, rural construction is often out of touch with the regional planning conceptions. It follows unapproved general blueprints or none, without system, without adhering to functional zoning of the land as to purpose, without consideration of the potential of the village, without adhering to hygienic requirements.

ON THE SHORT-TERM TRANSPLACENTAL EFFECT OF URETHAN ON THE ORGAN
CULTURES OF EMBRYONAL PULMONARY TISSUE IN MICE

T. S. Kolesnichenko, V. A. Kreitnitskaya

Institute of Experimental Oncology of the Academy of Medical Sciences of the USSR,
Moscow

Predadenomatous alterations — diffuse hyperplasia of the epithelium develop in cultures of the embryonal pulmonary tissue of mice following short-term transplacental action of single high urethan doses. With the increase in the duration of the experiment their frequency augmented but no change-over of diffuse hyperplasia to a focal one or to adenoma was recorded. The results testify to the importance of not only the dosage of the substance, but also to the time of its action necessary for the blastomogenic effect of urethan to become manifest.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE THEORETICAL FUNDAMENTALS FOR HYDRODYNAMIC MULTIPLE BUSHING SLIDE BEARINGS ARE INVESTIGATED FOR THE CASE OF THEIR STATIC LOAD. SIMILAR BEARINGS ARE USED AS GUIDE SUPPORTS OF HYDRAULIC UNITS. CONCRETE RESULTS ARE PRESENTED FOR THE DESIGN OF THE PILOT BEARING OF A HYDROTURBINE, WHICH IS INSTALLED AT THE MAIN HYDROELECTRIC POWER STATION OF THE VAKHSHSKY CASCADE.
